

Lab 2 – Windows 10 Client Domain Join + DNS Configuration + Remote

This lab demonstrates configuring a Windows 10 workstation in a realistic Active Directory environment.

Steps performed:

1. Installed Windows 10 in VirtualBox, created localadmin account.
2. Confirmed IPv4 connectivity and DHCP assignment.
3. Set DNS to the domain controller at 10.0.0.124.
4. Verified DNS resolution with ipconfig, ping, and nslookup.
5. Joined Win10-Client to lab.local domain.
6. Logged in as LAB\Administrator and LAB\testuser to validate domain authentication.
7. Enabled Remote Desktop on the client.
8. Added LAB\testuser to Remote Desktop Users.
9. Successfully connected via RDP from the server to the client (10.0.0.52).

This lab demonstrates core sysadmin skills: DNS, AD domain join, workstation provisioning, remote access configuration, and environment validation.
